Abstract. This document presents the Olmeca team that represents the Universidad Tecnológica del Sureste de Veracruz, through the Jaguarbot robot to participate in the RoboCup@Home Education 2022. The main task to be solved by the robot is voice recognition to execute a movement command of the servomotors in the robotic arm, as well as the use of vision sensors for tracking a person.

1 Introduction

The Olmeca team is conformed by students and professors from the Mechatronics Engineering career at the Universidad Tecnológica del Sureste de Veracruz to participate in the RoboCup@Home Education 2022. Web site: <http://www.robotica.utsv.mx/en/robocup-en/> Classification video: <https://www.youtube.com/watch?v=e1q-qy87q1> The team is formed by: Mechatronics study program students: Melvin Ramón Leal Quiroz, Javier de Jesús Rosales Osorio, Ingrid Amairani Angel Almeida. Mentoring team: Julio César Sandria Reynoso (MSc in Artificial Intelligence) Anabel Bellido Varela (Mechatronics Engineer) Adolfo de Jesús Pedraza Monge (Mechatronics Engineer) Diana López López (Mechatronics Engineer) Héctor David Kennedy Cabrera (MSc in Micro and nanosystems). The Technological University of the Southeast of Veracruz participates for the third time in the Robocup contest at home, with the name of robot jaguarbot (inspired by the Olmec jaguar that symbolizes the darkness of mother earth and bot derived from the word robot capable of carrying out operations autonomously), so far in 2022 we have participated in the TMR2022 in Mexico, where we obtained special recognition for the best poster.

It has a special interest in participating in the Education league, providing implementations in the field of service robots through the commercial robot

Jupiter from the LattelRobotics company, has experimented with vision control, motorization planning, robotic arm control, as well as voice recognition to execute tasks.

In the following months, it is planned to work in real environments such as university classrooms, local restaurants and shopping mall parking lots. in order to acquire greater knowledge and sensitize our community about the high relevance of these automata.

Details of the robot hardware and software are found in the annex. The main task to be solved by the robot is voice recognition to execute a movement command of the servomotors in the robotic arm, as well as the use of vision sensors for tracking a person.

In the development of this work our main references were [1,2,3,4],

2 Research focus and interests of the group

The focus of this university group is to implement robot or automaton technology, applying navigation and visualization techniques to carry out service activities in small university classrooms through tasks where the interaction of people can be supplied in support of the post-covid scenario. In addition to using the robot as a pedagogical tool for teaching different subjects as a multidisciplinary project within the university.

2.1 Innovative technology and scientific contribution

We are at the university a small group that begins to work in these areas of mobile and service robotics, using the training of Robocup @ Home Education and the company Lattel Robotics organized by Dr. Jeffrey Too Chuan Tan, as well as by a group of teachers and students of the Autonomous University of Mexico (UNAM).

3 Robot Development

3.1 Open source Robot Platform

The platform used is that of the Jupiter robot, a robot designed for educational solutions, it is an open platform, it has systems that personalize it (manipulator system, upper and lower vision, microphone, speakers) functions used for speech recognition applications and follow me. The robot has a TurtleBot 2 platform, the TurtleBot2 can execute SLAM algorithms (simultaneous location and mapping) to build a map and drive around the room or stage, it has a mounting structure where various types of hardware can be placed, as well , has software for its control, libraries for visualization, planning and perception is compatible with ROS.

ROS: Robot operation system it is open source software for the Robot, which provides us with a large collection of robotic tools and libraries. With Ros as

fundamental software, it allows the work to be adapted so that we can carry out the manipulation of the navigation, vision and speech functions of the robot to be able to carry out the task in robocup home.

Fig. 1. Robot accesories.

Robot navigation: The Kobuki system and the MS Kinect sensor are the mobile base of the robot, the navigation package is from Turtlebot, the previous application is used for the recreation of maps with Gmapping and localization with Rviz running ROS on Ubuntu 16.04 LTS.

The robot can go to a certain location that is indicated from the map, generating a navigation route. Robotic arm and manipulation of objects: We are using TurtleBot Arm9 for object manipulation. It consists of 5 Dynamixel AX-12A servo motors, controlled by an ArbotiX-M / USB2 Dynamixel controller board. A raised arm is developed for flexible height manipulation. The current design aims to allow the manipulation of objects in height ranges from 0.4 m to 0.8 m. Fig 1. Speech interaction and location of the sound source: For human speech interaction we use CMU pocketsphinx, as our Robot is a lightweight speech recognizer, it is based on a support library called sphinxbase. The recognizer requires a language model and a dictionary file that can be built automatically from a corpus of sentences, for text to speech (TTS) we are using the CMU festival system together with the ROS package sound-play. In order to improve the efficiency of speech recognition, we use a strategy for the robot to hear the trigger keyword, recognize itself, and switch to searching for programs to recognize the actual command. Once the command has been recognized, the robot can switch to grammar search to acknowledge confirmation and then return to keyword listening mode to wait for another command.

4 Robot application relevance

Different packages are used so that the robot can carry out activities such as: the initialization of the Turtlebot base, the enablement of the arm motors, the

spatial vision for tracking people, as well as the configuration of voice recognition from the development from a dictionary where it is capable of executing activities such as "open" the claw of its arm to hold a bag or luggage, as well as following the person to a specific point, the latter was worked with the python programming language. With this application of the robot you can work with the implementation of mapping, travel sensors, tasks are optimized from voice commands, it allows detecting obstacles and avoiding them, the efforts made in this work group allow articulating the different university careers and promote the adoption, adaptation and use of free software and hardware.

5 Team Description 2021-2023 Team Olmeca

The Olmeca team of the Universidad Tecnológica del Sureste de Veracruz was created in March 2021 with the purpose of participating in robotics competitions nationally and internationally, where its first participation was in the Robocup 2021 Japan in the major league @Home, where It was possible to acquire knowledge and experience for future events, in addition to the fact that the same team members were trained by doctors and teachers related to the subject of robotics, granting the bases and skills to function in the competitions as well as in the area.

Fig. 2. Olmeca Team 2021.

In the first experience in the @Home league, several teams including the Olmeca Team were instructed on topics related to the competition, whose information was highly important for a better understanding of the event.

In 2022 the team participates in the Mexican Robotics Tournament in the @Home category where we had a good performance in the "Test in Stage I" and "Test in Stage II" tests. The Olmeca team gained a recognition to the best poster in this event.

Fig. 3. Olmeca Team in TMR 2022.

In August 2022, the team participated in Robocup Thailand 2022, where a simulation of a domestic task carried out by the robot was presented, as well as its operation in a test environment, complying with the "Follow me" function.

In 2023, Olmeca Team has new members who are engineering students who are supervised by members and mentors with more experience in this field.

Annex: Jaguarbot Hardware Description OPL

Universidad Tecnológica del Sureste de Veracruz. The Jaguarbot robot is based on the design of the Jupiter robot from the LattellRobotics company. Specifications are as follows:

- Base: Turtlebot 2, 50cm/s max speed.
- Robot dimensions: height: 0.92 m (max), width: 0.35 m depth 0.35m
- Robot dimensions: height: 0.92 m (max), width: 0.35 m depth 0.35m
- Robot weight: 9.5 kg.
- Maximum angular speed: 180 deg/s
- Vertical slope: overcome slopes greater than 5 cm in height
- Maximum slope: Overcome slopes of up to 12mm.
- Operating times: 3-7 hours

Also our robot incorporates the following devices:

- Motor overload detection
- Odometry: 25718.16 ticks/ revolution.
- Gyro: Default calibration, 1 axis (100 deg/s).
- Bumpers: Left, center, right.
- Status LED
- Battery: Lition-Ion 2200mAh
- Computer: Intel NUC i5, 120GB SSD, 8 GB DDR

Robot's software Description

For our robot we are using the following software:

- Platform: Ubuntu Operating system 16.04 LTS.
- Navigation: Kobuki drivers for ROS and other C++ environments, Gazebo
- Face recognition: OpenCV
- Speech recognition: based in language model mode Sphinx
- Speech generation: based in language model mode Sphinx

External Devices

Jaguarbot robot relies on the following external hardware:

- Microphone: 1 omni-directional condenser by Taktar.
- Speakers USB plug 3.5 mm.
- Camera: 2 Astra S 3D
- Arm degree of freedom: 5
